

Holder for snap on baby bottle caps

Abstract

The provides a mechanism to help ensure that a snap on baby bottle cap is kept together with the baby bottle while the baby bottle is in use so that the snap on baby bottle cap does not get misplaced or lost entirely. The baby bottle cap can be kept loosely attached to the baby bottle by one flexible ring designed to fit directly around the baby bottle cap and another flexible ring that fits around the baby bottle. The two holding rings are attached to each other via a connector that is made of suitable material of sufficient length to connect the two rings together while allowing the baby bottle cap to be placed atop the bottle when the **baby bottle cap holder** is around the baby bottle.
